New accreditation for Catomance laboratories

Catomance Technologies Ltd has added new chemical analysis services to its textile testing facilities.

As an international supplier of speciality finishing agents to the textile industry, Catomance Technologies has become widely acknowledged for its anti-microbial treatments. Specialist laboratory facilities and expertise in materials protection support Catomance's customers world-wide.

The company's laboratories also hold the prestigious United Kingdom Accreditation Service (UKAS) accreditation, performing chemical analysis on textiles as well as mould resistance challenge testing to recognised national and international standards. Advanced digital photography and microscopy is used in the preparation of comprehensive test reports, which are made available to customers in CD-ROM format.

The chemical analysis of textiles treated with Catomance's new range of textile preservatives has now been added to the scope of its UKAS accredited testing. Gaining ground in world markets, the new Mystox range from Catomance is also supported by internationally recognised accreditation for its analytical services.
