Catomance introduces new textile preservatives range

Catomance has reinforced its commitment to the development of textile preservation technologies with the introduction of a new product range.

Based on low-dose active ingredients with minimal environmental impacts, the new products have been launched under Catomance's well-established Mystox brand.

Following detailed evaluation by the UK's Ministry of Defence, the new textile preservatives have been approved to meet the stringent requirements of military textile protection. The products are equally suitable in commercial textile applications.

With a favourable eco-toxicological profile, the active ingredients also show a high level of resistance to water leaching and UV light, making the treatment highly durable under in-service conditions.

Using its detailed knowledge of industrial and technical textile processing, Catomance has developed a range of products designed for ease of use in a variety of textile finishing operations. Including combined finishing with water repellents and flame retardants, the new range contains emulsion-based products for padding applications together with a concentrate used in dry-chemical proofing and in polymer coatings for textiles.
