MYSTOX HP

Leather Auxiliary Product Data

- Function** Fungicide for protection of wet skins in process, including wet blue stock, pickled pelts and vegtan processed stock.
- Composition** Self emulsifying concentrate containing IPBC. The active is fully supported under the European Biocidal Products Directive for this application.
- Description** Low odour, straw coloured mobile liquid which forms an emulsion in water.
- Concentration** An addition of 0.08% Mystox HP has been shown to give protection in excess of 3 months in laboratory conditions ideal for mould growth. In normal routine production, protection would be expected in excess of this figure as long as application guidelines have been adhered to. It is recommended that optimum concentration be determined by trial, up to a maximum concentration of 0.15% Mystox HP, depending on the degree of protection required.
- Application** It is recommended that Mystox HP is diluted in water just prior to addition. The diluted product can be added at an early stage in wet processing and is added directly to the drum.
- Handling** Mystox HP should be handled with care.
- The product is irritative to eyes and skin, so eye protection and gloves should be worn.
- For further information, see our Safety Data Sheet.
