MYSTOZYME ECO-S

LEATHER AUXILIARY PRODUCT DATA

Function An enzymatic liming auxiliary for use in sodium sulphide liming operations.

Mystozyme ECO-S significantly reduces the sodium sulphide requirement in traditional liming situations, and may be used in either hair-save or hair-destroy

processes.

Composition Alkaline proteases in an inert carrier.

Description Mottled beige/white, free-flowing powder.

Application Mystozyme ECO-S is typically used at a concentration of 0.3% in either a hair-

save or hair destroy process. The precise concentration required and the processing conditions will depend on a number of factors and should be

determined by trial.

Benefits Mystozyme ECO-S is both stable and active in the presence of sodium sulphide

and can be used to accelerate the depilation process. The hides produced are

cleaner, and the final leather yield can be increased.

The use of Mystozyme ECO-S can bring significant environmental benefits. The amount of sodium sulphide needed in the dehairing process is significantly reduced (typically by up to 50%) and, by using the hair-save process, COD,

BOD and nitrogen in the waste water can be cut dramatically.

Handling Product should be stored in a cool, dry place.

Avoid skin contact and dust inhalation.

See Safety Data Sheet for further information.
